

Paramora

Parametric Crop Insurance on Blockchain
Fast • Transparent • Automatic Protection for
Smallholder Farmers

Maharashtra Implementation

The Problem

Smallholder farmers in rainfed regions like Maharashtra (Pune, Baramati, Marathwada, Vidarbha) suffer heavy losses from erratic rainfall — drought during sowing or excess during harvest

Traditional schemes like PMFBY involve complex claims, long delays, and low trust, leaving many unprotected.

Our Solution

Paramora is a live MVP dApp deployed on Base Mainnet. Farmers (or FPO representatives) sign up easily by connecting a MetaMask wallet. When rainfall crosses predefined thresholds, payouts trigger automatically via Chainlink oracles and Automation — no paperwork, no claims process.

Payouts settle directly in ETH to the registered wallet, with full transparency on Etherscan. Gas fees are currently very low (~0.05 Gwei), making transactions affordable.

How It Works

1. Connect MetaMask → Register policy (crop + district-specific rainfall triggers).
2. Chainlink monitors real-world weather data (IMD/ public sources).

3. Trigger hit (e.g., deficit rainfall in critical growth stage) → Smart contract automatically executes payout in ETH.

We are actively reaching out to FPOs, KVKs, and SFAC networks for running no-cost pilots in Maharashtra

- Target: 100–500 farmers initially
- We fund the contract and cover all payouts during the pilot
- Simple onboarding with FPO/KVK support for wallet and distribution (UPI/bank transfer if needed)
- Full data insights and transparency provided to partner organizations

Key Benefits

- Farmers: Instant, trust-based compensation that complements government schemes
- FPOs / KVKs / SFAC: Ready value-add service to strengthen member resilience
- Technology: Live on Base Mainnet with Chainlink for verifiable, tamper-proof automation

Why This Matters Now

This pilot aligns with national priorities on climate resilience and digital agriculture. It also fits IRDAI's Regulatory Sandbox framework (2025 regulations), which encourages testing of parametric and blockchain-based insurance innovations in a controlled environment.
